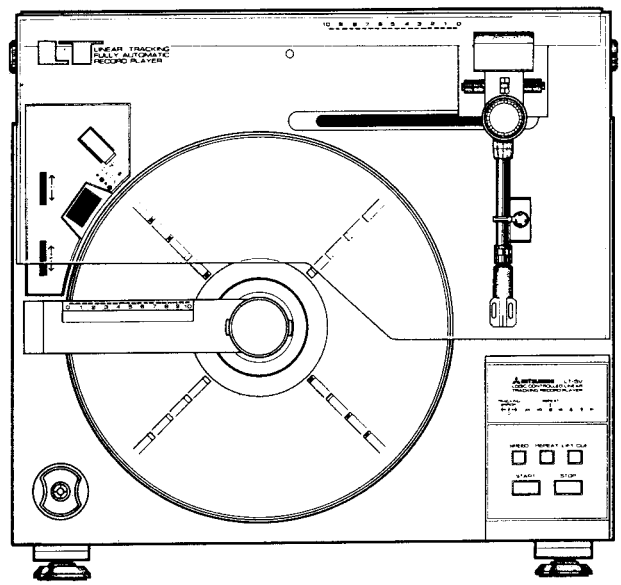
LINEAR TRACKING TURNTABLE

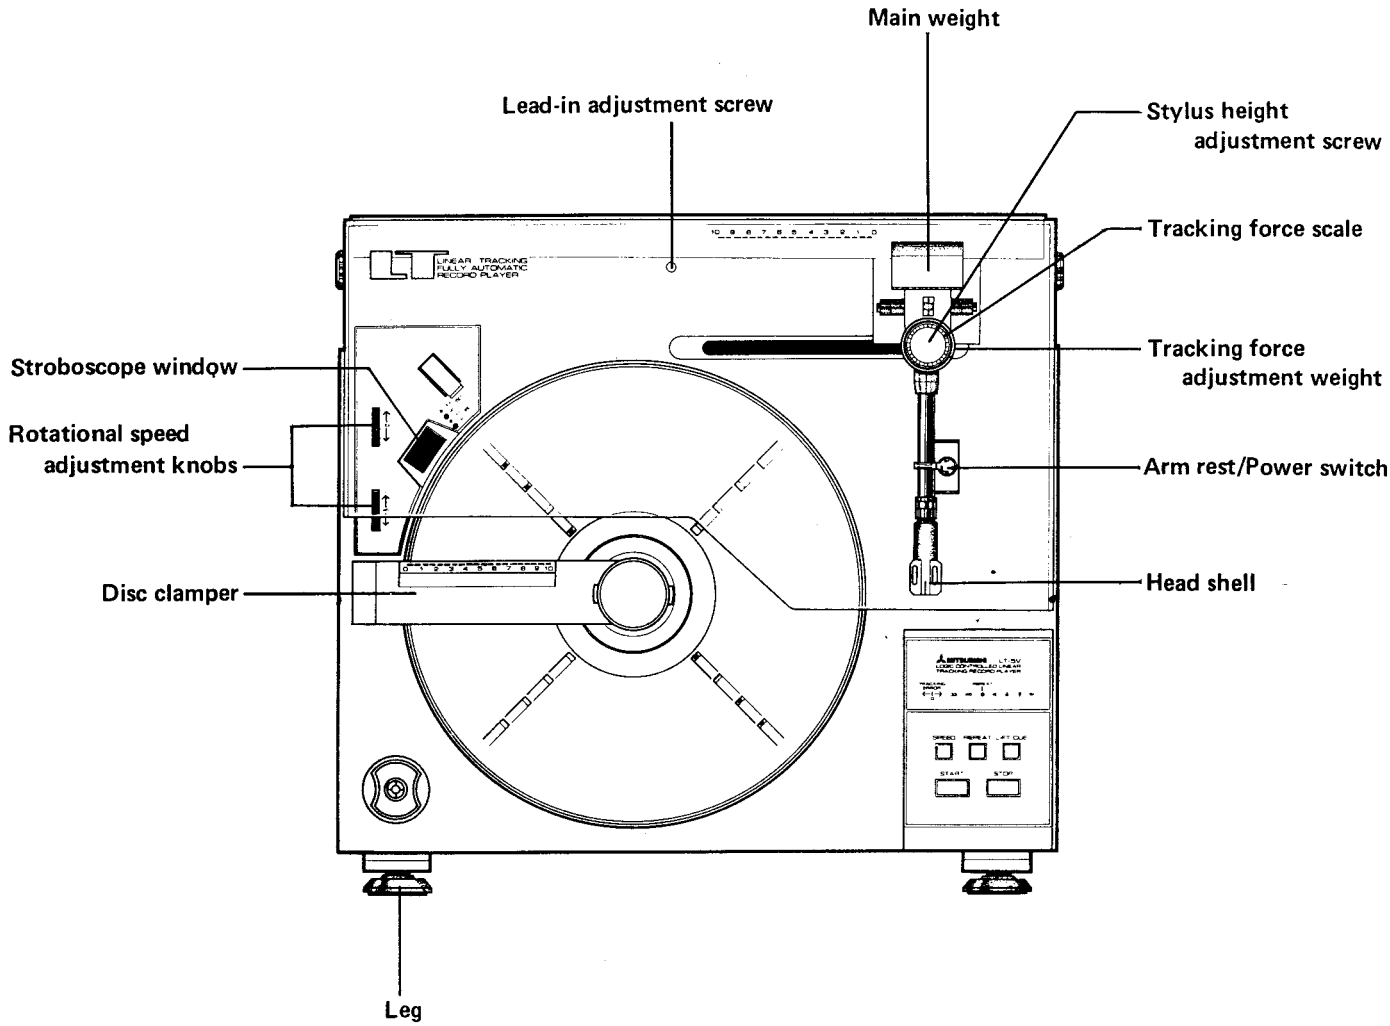
MODEL LT-5V

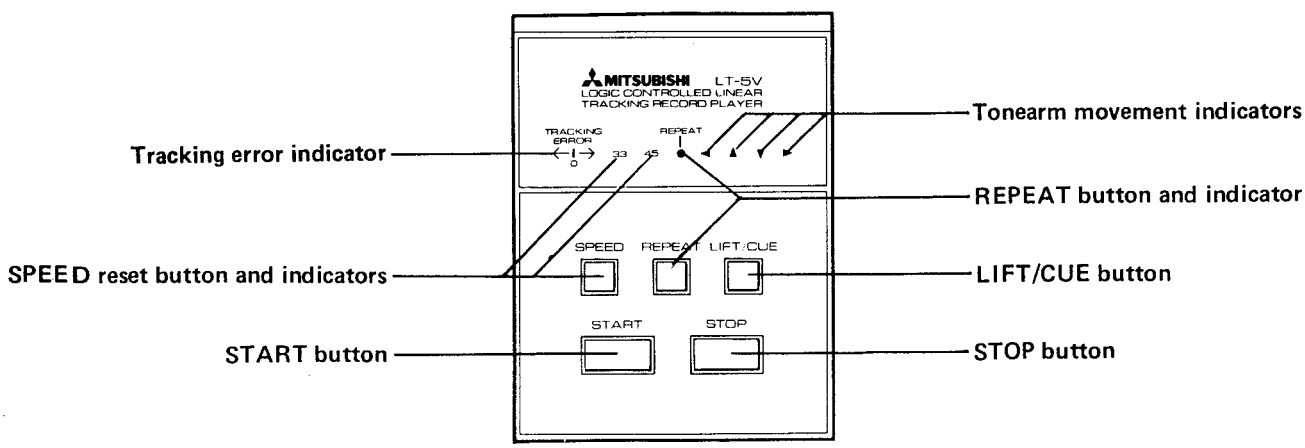


CONTENTS

MITSUBISHI ELECTRIC CORPORATION

NAMES OF PARTS





SPECIFICATIONS

1. PHONO MOTOR SECTION

Drive system		Belt drive
Motor		PLL DC servo motor
Platter	**Size**	30.4 cm (12")
	Weight	1.3 kg (2.9 lb)
	Material	Aluminum diecast
Platter speed		33-1/3, 45 r.p.m.
	Selection	Automatic
	Adjustment	±3.0 %
Wow and Flutter		±0.045 % (Wrms)
Signal to noise ratio		65 dB (IEC-B)
		76 dB (DIN-B)

2. TONEARM SECTION

Type	Straight universal type, static balanced
Overall length	22.3 cm (8-3/4")
Effective length	18.0 cm (7-1/12")
Overhang	14 mm (9/16")
Tracking error	±0.1°
Head shell	GFRP (6.2 g)

3. CARTRIDGE SECTION

Model	AT-12E (Audio Technica)
Type	Dual moving magnet
Stylus	0.4 x 0.7 mil elliptical diamond
Recommended traking force	1.5 g
Output level (1kHz, 5 cm/sec)	3.5 mV
Frequency responce	15 ~ 26.000 Hz
Channel separation (1 kHz)	23 dB

4. GENERAL

Power consumption	14 W
Dimensions (W x H x D)	466 x 430 x 200 mm (18-3/8 x 16-15/16 x 7-7/8")
Weight	12.5 kg (27.5 lb)

Design and specifications are subject to change without notice for improvement.

GENERAL ADJUSTMENTS

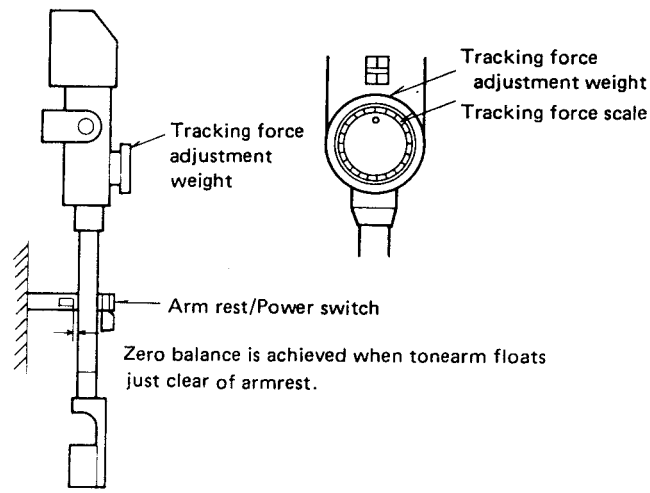
1. Tracking Force Adjustment

(1) Attach the cartridge (mounted on head shell) to the tonearm.

(2) Adjust the tonearm for zero balance by rotating the tracking force adjustment weight. Zero balance is achieved when the tonearm stays just clear of the armrest and remains suspended vertically.

(3) Rotate the tracking force scale so that the 0 mark points upwards. While turning the dial, hold the tracking force adjustment weight so as not to disturb its position.

(4) Rotate the tracking force adjustment weight until the indication on the scale matches the tracking force recommended for the cartridge in use. By turning the weight counter-clockwise, it is pushed out and the tracking force increases.



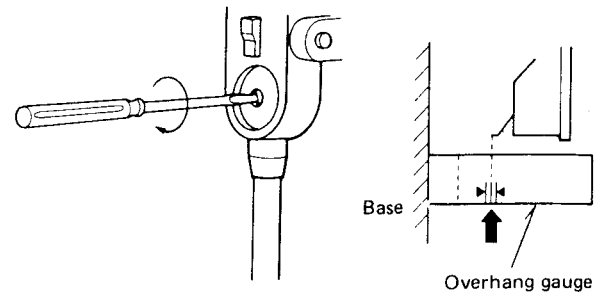
2. Stylus Height Adjustment

(1) Remove the main weight by pulling it upwards.

(2) Remove the tracking force adjustment weight by turning it counter-clockwise.

(3) Turn the power ON and move the tonearm to the UP position with the LIFT/CUE button.

(4) Hold the overhang gauge vertically to the turntable base and adjust the stylus height. The adjustment screw is located in the opening for the tracking force adjustment weight. Turning it clockwise increases the stylus height.



3. Adjustment of Lead-in Position

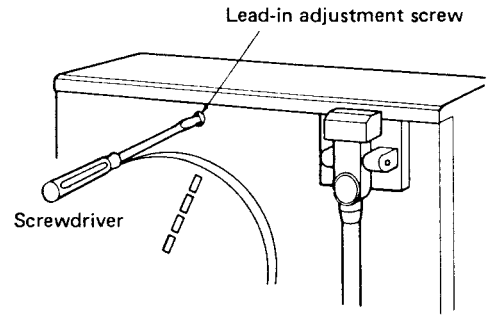
In case the stylus does not correctly descend in the lead-in groove of a record, perform the following adjustment.

(1) Make sure that the turntable is positioned horizontally. Place a 30cm record on the platter and check to which side the stylus is off position.

(2) Adjust the lead-in position gradually by turning the lead-in adjustment screw.

(3) After having performed the adjustment for a 30cm record, repeat the same adjustment with a 17cm record.

Note: If the stylus sets down outside of the turntable, or the lead-in position is set too far inward, the automatic end-of-play shut-off may become inoperative.



CIRCUIT DESCRIPTION

1. Start Switch ON

When the start switch S106 becomes ON, L is fed into pin 9 (START) of IC102, and because pin 21 (↑) goes L, Q120 turns OFF, Q121 becomes ON, and Q122 turns OFF. Because pin 22 (↓) is H, Q117 becomes ON, Q118 OFF, and Q119 ON. This starts the vertical motion motor and the tonearm is lifted up. Also, as Q120 goes OFF, H is fed to the base of Q204, causing Q203 to turn ON and LA207 (↑) to illuminate. (Signal flow shown by blue ➡ on schematic diagram.)

2. Tonearm Elevation Stop

As the CAM/UP switch S102 is switched to NO (Normally open), L is applied to pin 4 ($\overline{UP}$) of IC102, the vertical motion motor stops and the elevation of the tonearm ceases.

3. Horizontal Tonearm Movement (Inwards)

As pin 23 (←) of IC102 becomes L, Q109 turns OFF, Q111 ON, and Q112 OFF. Because 22 (→) is H, Q113 becomes ON, Q115 OFF, and Q116 ON, causing the horizontal motion motor to operate and move the tonearm inwards. Also, as Q109 turns OFF, Q201 turns ON and LA204 (←) illuminates. (Signal flow shown by blue ▷ on schematic diagram.)

4. Record Size Detection (30cm Record)

When a 30cm record is placed on the turntable, the size detector Q101 receives no light and turns OFF. Thus Q103 goes OFF, and H is fed to pin 12 and pin 13 of IC101, causing L to be outputed from pin 11. L is placed on pin 15 (SIZE) of IC102, (Shown by blue ▶ on schematic diagram.) Because Q105 turns ON, the position light source LA101 goes on and the position light receiving photo diode D101 receives light. Thus H is imposed on the base of Q107 and it turns ON.

5. Tonearm Lowering

As pin 1 ($\overline{S\text{-}LEAD\text{-}IN}$) of IC102 changes from H→L, pin 21 (↓) changes from H→L, and Q117 turns OFF, Q118 ON and Q119 OFF. At that time, because pin 20 (↑) is H, Q120 is ON, Q121 OFF and Q122 ON. This causes the horizontal movement of the tonearm to stop and the tonearm to start lowering. Also, because Q117 is OFF, Q203 turns ON and LA206 (↓) illuminates. (Shown by red ➡ on schematic diagram.)

6. Tonearm Lowering Stop

First the CAM/UP switch S102 switches from NO to NC (Normally closed) and pin 4 ($\overline{UP}$) of IC102 becomes H, then the CAM/DOWN switch S103 switches from NC to NO and the vertical motion motor stops. The tonearm now rests on the record.

7. Operation of Tracking Servo Circuit

When S102 and S103 are switched as described in Step 6, pins 1 and 2 of IC102 become H, causing pin 3 to become L, and H is outputed at pin 4. Thus Q137 turns ON, causing the relay RL102 to switch to tracking servo. However, as the stylus of the cartridge follows the record groove, the tonearm is tilted inwards. This tilt causes the light interruption board to shut off the light from LA104, reducing the voltage from D107 and causing pin 2 of IC 103 to become L and pin 1 to become H. Thus pin 7 of IC103 becomes H, Q129 and Q130 go OFF, Q131 turns ON, and Q132 OFF. On the other hand, the light from LA105 is increased and the voltage from D108 increases accordingly, imposing H on pin 2 of IC104 and causing pin 1 to become L. Then, because pin 7 of IC104 goes L, Q133 and Q134 turn ON, Q135 turns OFF, and Q136 ON. When Q132 turned OFF, H was inputed into pin 3 of IC201, causing pin 1 to become H, Q205 to turn ON and LA201 (←) to illuminate. In this

way, the voltage difference between D107 and D108 is amplified, operating the horizontal motion motor and moving the tonearm inwards. When the tonearm becomes exactly vertical again, the voltages from D107 and D108 are equal and the motor stops. When the tonearm is again tilted by the movement of the stylus, the above process is repeated, and so forth until the tonearm has reached the end groove of the record. (Shown by blue ⇨ on schematic diagram.)

8. End Detection (Tonearm Lift)

When the tonearm moves to the end groove of a record, D103 receives the END light and produces a voltage, causing Q108 to turn ON and L to be fed to pin 2 ($\overline{\text{END}}$) of IC102. First, pin 20 (↑) of IC102 becomes H, causing Q120 to turn OFF. Q121 to turn ON, and Q122 to turn OFF. Because pin 21 (↓) of IC 102 is H at this time, it causes Q117 to turn ON, Q118 to turn OFF, and Q119 to turn ON. Thereby, the vertical motion motor starts to operate and the tonearm is lifted up. (Indicator lamps are the same as in Step 1. Signal flow shown by red ▷ on schematic diagram.)

9. Tracking Servo Circuit Release

When the tonearm moves upwards and the CAM/DOWN switch S103 switches to NC, pin 2 of IC101 goes L, and because pin 1 is H, pin 3 becomes H and pin 4 becomes L. Thus Q137 turns OFF and the solenoid RL 102 switches from tracking servo to normal.

10. Tonearm Elevation Stop

Same as in Step 2.

11. Horizontal Tonearm Movement (Outwards)

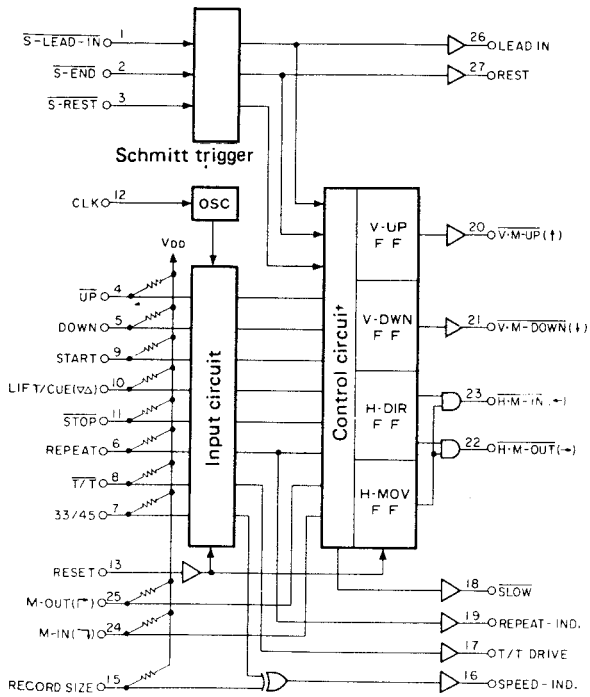
When the toneam reaches the upper limit pin 22 (→) of IC102 goes L, causing Q113 to go OFF, and Q116 to go OFF. At this time, because pin 23 (←) is H, Q109 becomes ON, Q111 OFF, and Q112 ON. Also, because Q202 is ON when Q113 is OFF, LA205 (→) illuminates. Accordingly, the horizontal motion motor operates and the tonearm is moved outwards. (Signal flow shown by red ▶ on schematic diagram.)

12. Tonearm Movement Stop

When the tonearm moves horizontally and reaches the armrest position, the REST switch S101 switches from NC to NO, and L is fed into pin 3 of IC102. As the horizontal motion motor stops, the vertical motion motor starts operating, the CAM/UP switch S102 changes from NO to NC, and the tonearm is lowered. When it reaches the lower limit, the CAM/DOWN switch S103 switches to NO, and the tonearm stops on the arm rest. (Indicator lamps are the same as in Step 5. Signal flow shown by red ▷ on schematic diagram.)

INFORMATION ON LOGIC I.C. (IC102)

1. Circuit Construction



2. Pin and Function

1 (S-LEAD-IN): L when tonearm is on a record, otherwise H.

2 (S-END): Becomes L when tonearm is moving inwards on a record and reaches the end groove, otherwise H.

3 (S-REST): L when at armrest, otherwise H.

4 (UP): L when tonearm is being lifted or moving horizontally, otherwise H.

5 (DOWN): L when tonearm is at armrest or on a record, otherwise H.

6 (REPEAT): Ordinarily H. When L is fed into this pin, the tonearm continues the repeat operation. To release, feed in L once more or make 11 (STOP) L.

7 (33/45): Used when selecting platter speed manually. Making this pin L causes speed to change from 33-1/3 rpm to 45 rpm or vice versa.

9 (START), 10 (LIFT/CUE), 11 (STOP): When START becomes L, the tonearm moves inwards; when STOP becomes L, the tonearm moves outwards. When LIFT/CUE becomes L, the tonearm is lifted or lowered. Note that, while the tonearm is being lifted, making this pin L produces no change, but if L is fed in during the lowering process, it changes back to upwards.

12 (CLK): By connecting an external resistor/condensor combination to the input, a reference clock pulse is generated internally.

13 (RESET): A resistor/condensor combination is connected to the input. Immediately after switching on the power, the RESET input becomes L, blocking automatic movement of the tonearm.

14 (Vss): Connects to ground.

15 (RECORD SIZE): L indicates 30cm LP, H indicates 17cm EP.

16 (SPEED-IND): L indicates 33-1/3 rpm, H indicates 45 rpm. Can be changed freely by making 7 (33/45) L.

17 (T/T-DRIVE): When 9 (START) becomes L, this pin becomes H and the platter rotates. When record play is finished and the returns to arm rest position, this pin becomes L and platter rotation stops.

18 ($\overline{\text{SLOW}}$): To move the tonearm horizontally while on a record, this output becomes L and the horizontal motion speed is low. At H level, the motion speed is high.

19 (REPEAT-IND): When 6 (REPEAT) is L in the repeat mode, this pin becomes L.

20 ($\overline{\text{V.M-UP}}$), 21 ($\overline{\text{V.M-DOWN}}$), 22 ($\overline{\text{H.M-OUT}}$), 23 ($\overline{\text{H.M-IN}}$): When the tonearm is at rest position or on a record and thus 5 (DOWN) is L, at first 20 ($\overline{\text{V.M-UP}}$) becomes L and the tonearm moves up, causing 5 (DOWN) to become H. At that time 4 ($\overline{\text{UP}}$) is L, and when the tonearm stops at the upper limit, the horizontal motion starts. When the tonearm moes inwards, 23 ($\overline{\text{H.M-IN}}$) is L, when it moves outwards, 22 ($\overline{\text{H.M-OUT}}$) is L. When the tonearm has moved to the pre-set horizontal position and is being lowered, 21 ($\overline{\text{V.M-DOWN}}$) becomes L. Thus, of these 4 signals during tonearm movement, there is always one which becomes L, but never two or more simultaneously.

27 ($\overline{\text{REST}}$): Same as output of 3 ($\overline{\text{S-REST}}$).

28 (Vpp): Supply voltage INPUT.

DISASSEMBLY INSTRUCTIONS

Removal of Rear Cover

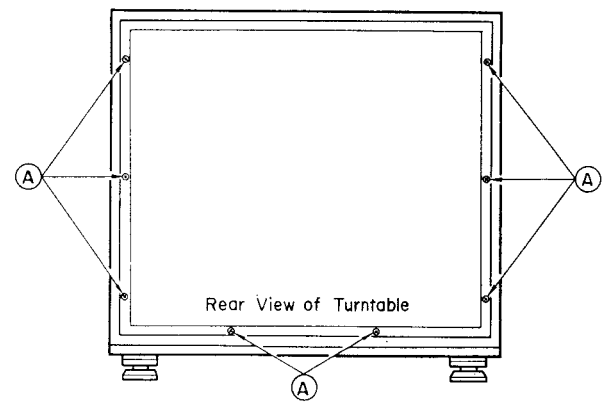
(1) Remove the eight screws Ⓐ as shown in the figure.
(2) The rear cover can now be removed.

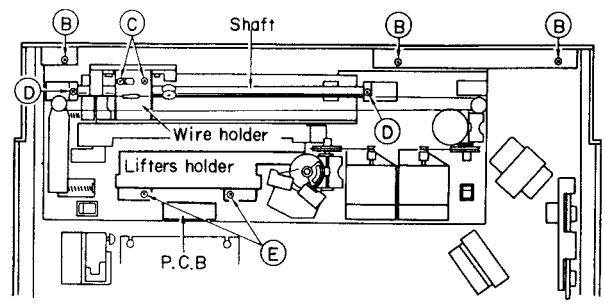
Removal of Turntable Platter

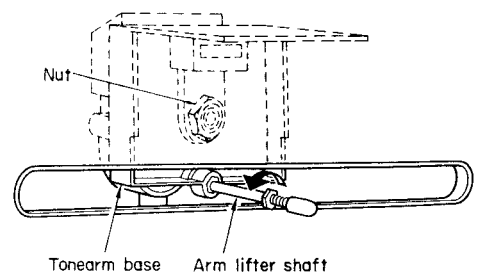
(1) Remove the rear cover as described above.
(2) Insert the supplied rod or a small hex wrench through the hole in the platter spindle. Using the rod as a lever turn the spindle in a clockwise direction. Remove the spindle.
(3) While holding the platter rotate the flyweel to loosen the platter. The platter can now be pulled off.

Removal of Tonearm

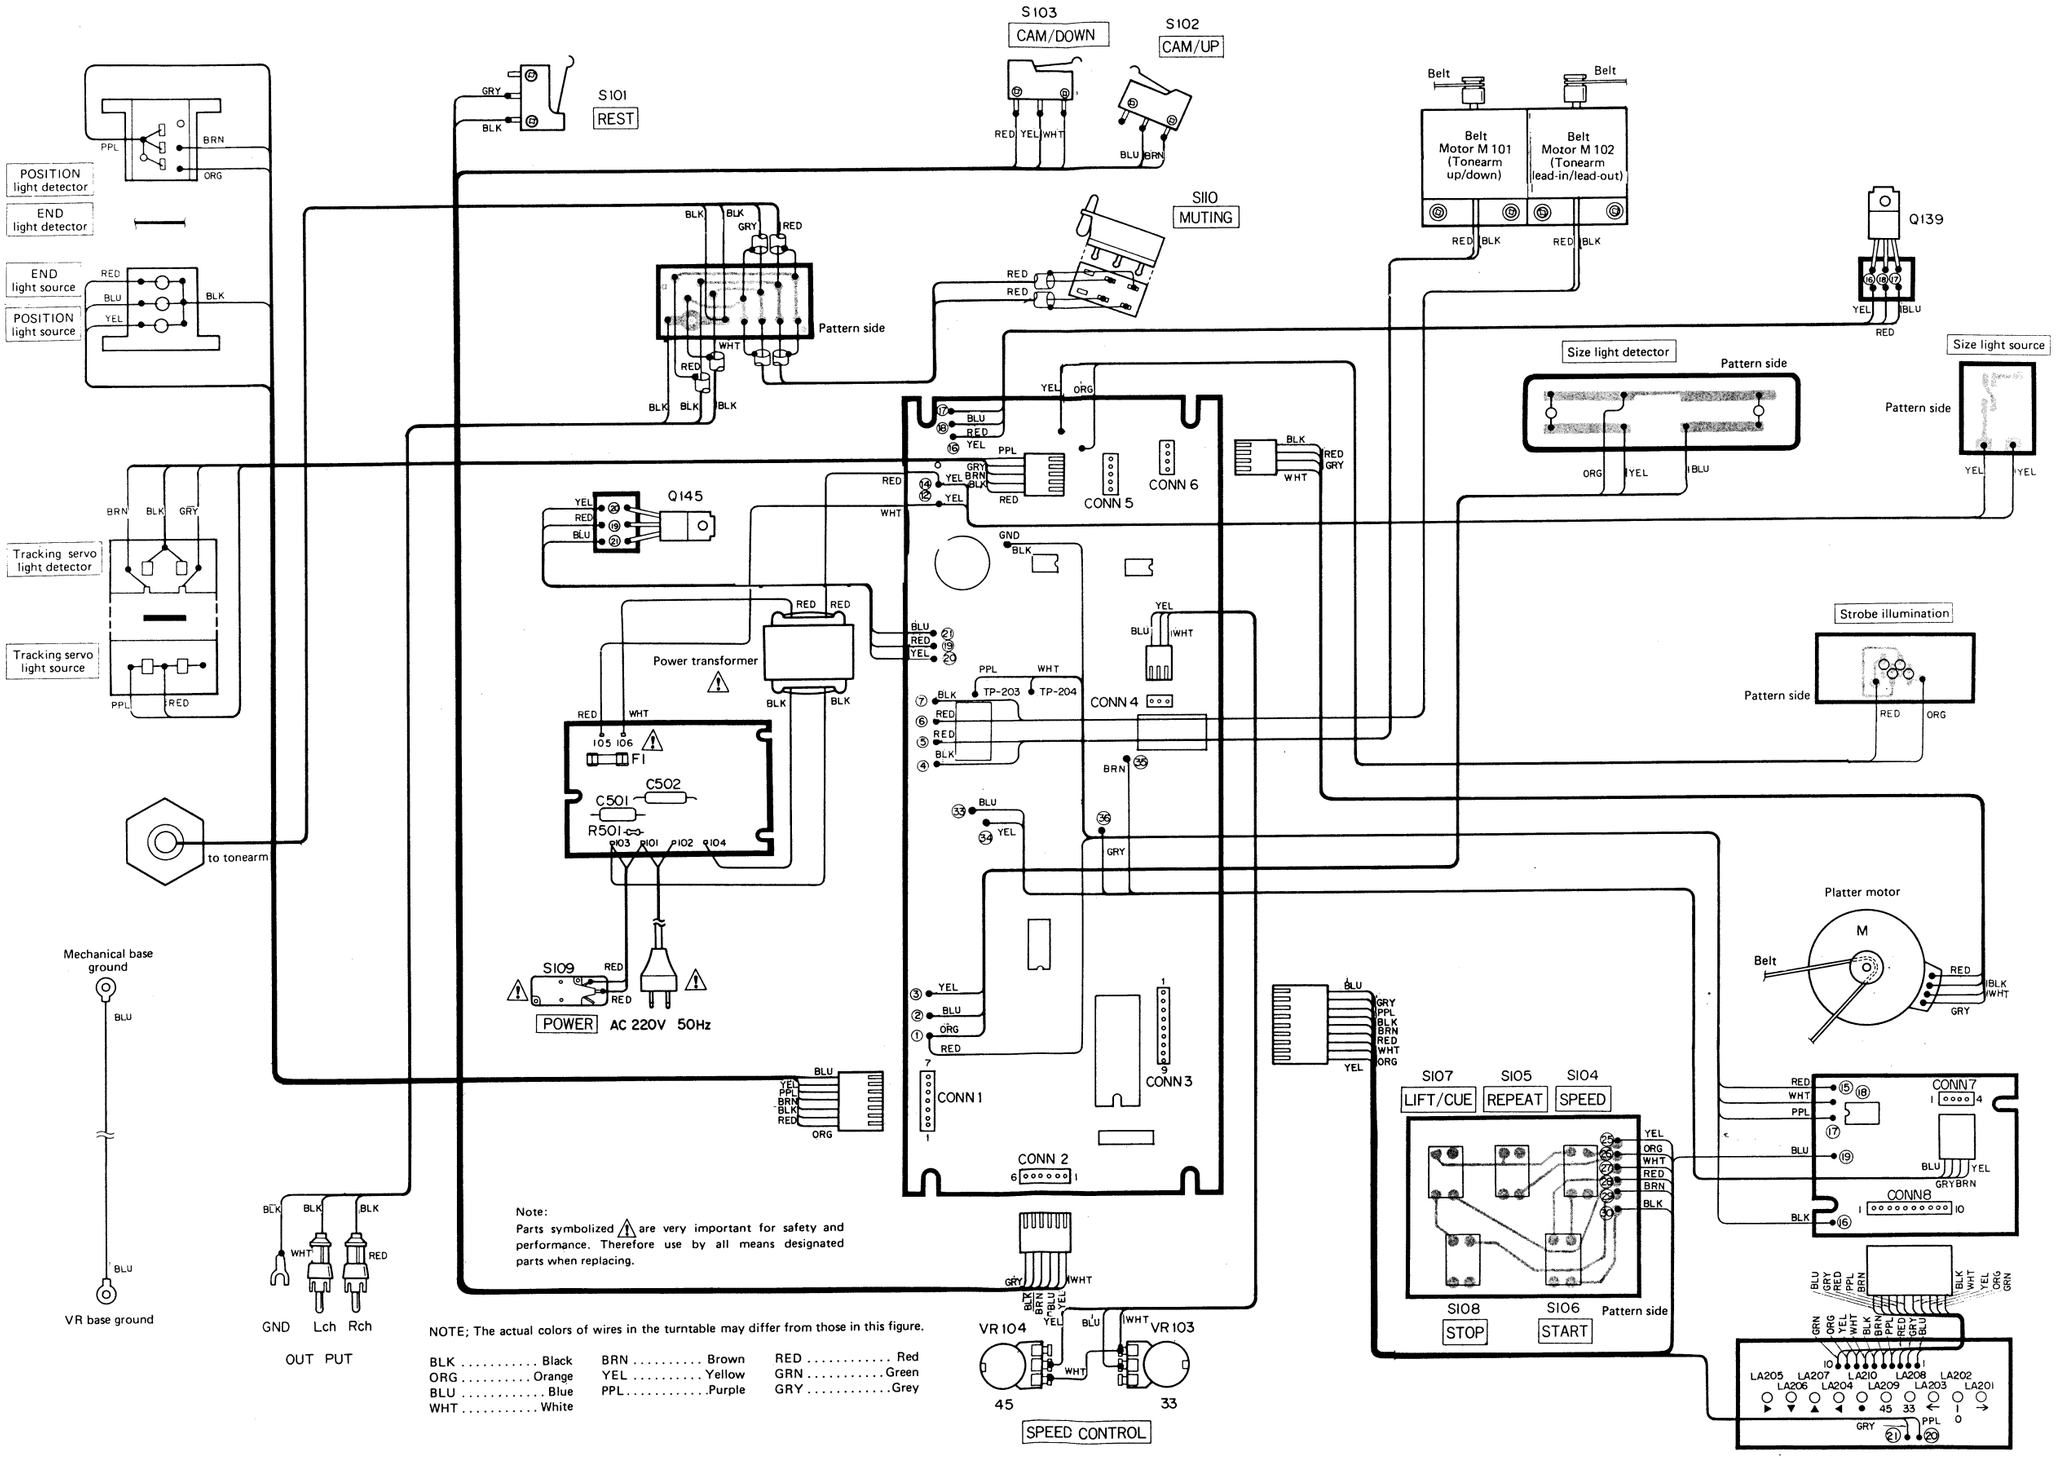
(1) Unscrew the three screws Ⓑ for the ornamental metal provided on the upper side and remove the metal. When removing the metal trim use care so as not to damage.
(2) Remove the two fixing screws Ⓒ for the wire holder.
(3) Losen the two fixing screws Ⓓ for the shaft and remove the shaft.
(4) Remove the two screws Ⓔ for the lifter's holder.
(5) Turn the arm lifter shaft attached to the tonearm base with a pair of pliers and remove the shaft.
(6) Now, the tonearm, together with the tonearm base, can be lifted upward and removed.
(7) Disconnect the output lead wires from the printed circuit board.
(8) Remove the nut securing the tonearm.
(9) In this condition, the tonearm can now be serviced.







WIRING DIAGRAM

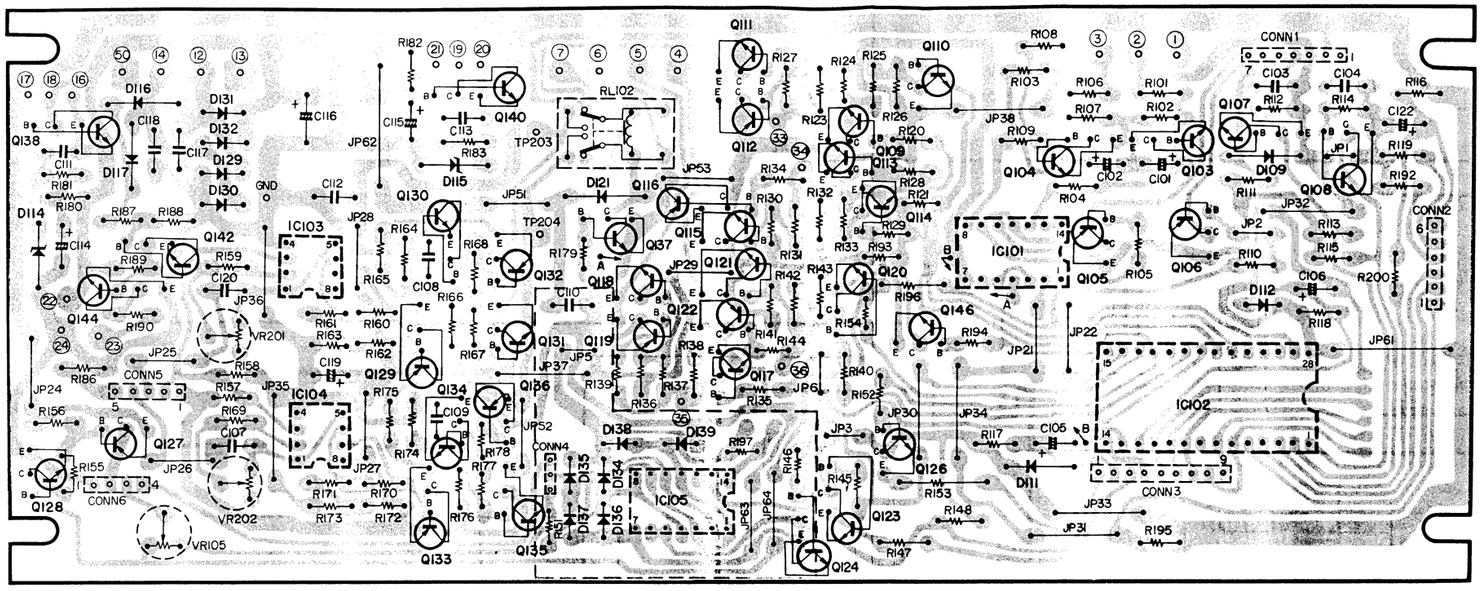


Note:
Parts symbolized ⚠ are very important for safety and performance. Therefore use by all means designated parts when replacing.

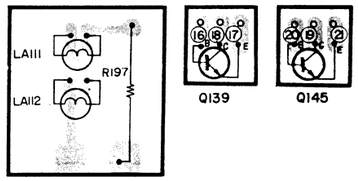
NOTE; The actual colors of wires in the turntable may differ from those in this figure.

BLK ..... Black	BRN ..... Brown	RED ..... Red
ORG ..... Orange	YEL ..... Yellow	GRN ..... Green
BLU ..... Blue	PPL ..... Purple	GRY ..... Grey
WHT ..... White		

PRINTED CIRCUIT BOARDS

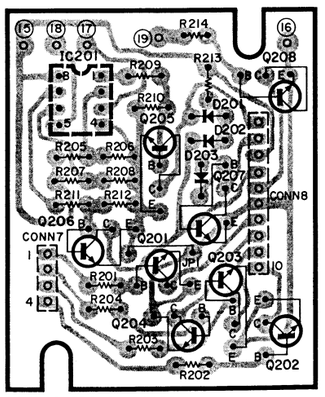


MAIN P.C. BOARD



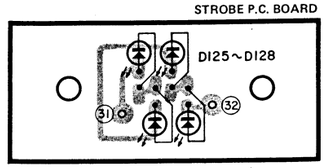
CAUTION
for WEST GERMAN;

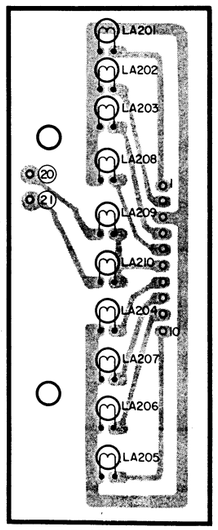
For the□□□□marked section, a relay circuit is used for sets with Serial Nos. up to 100, while an IC circuit is used for sets upward from 101.



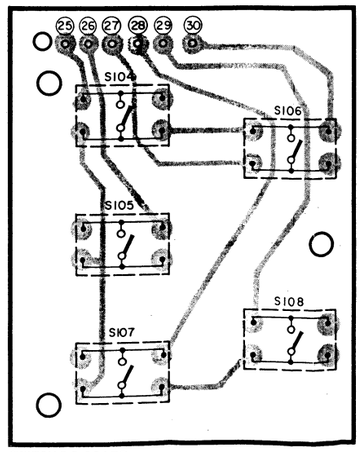
LAMP CONTROL P.C. BOARD

STROBE P.C. BOARD

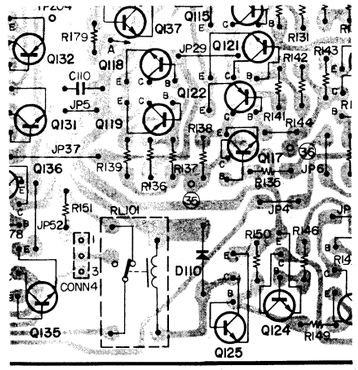




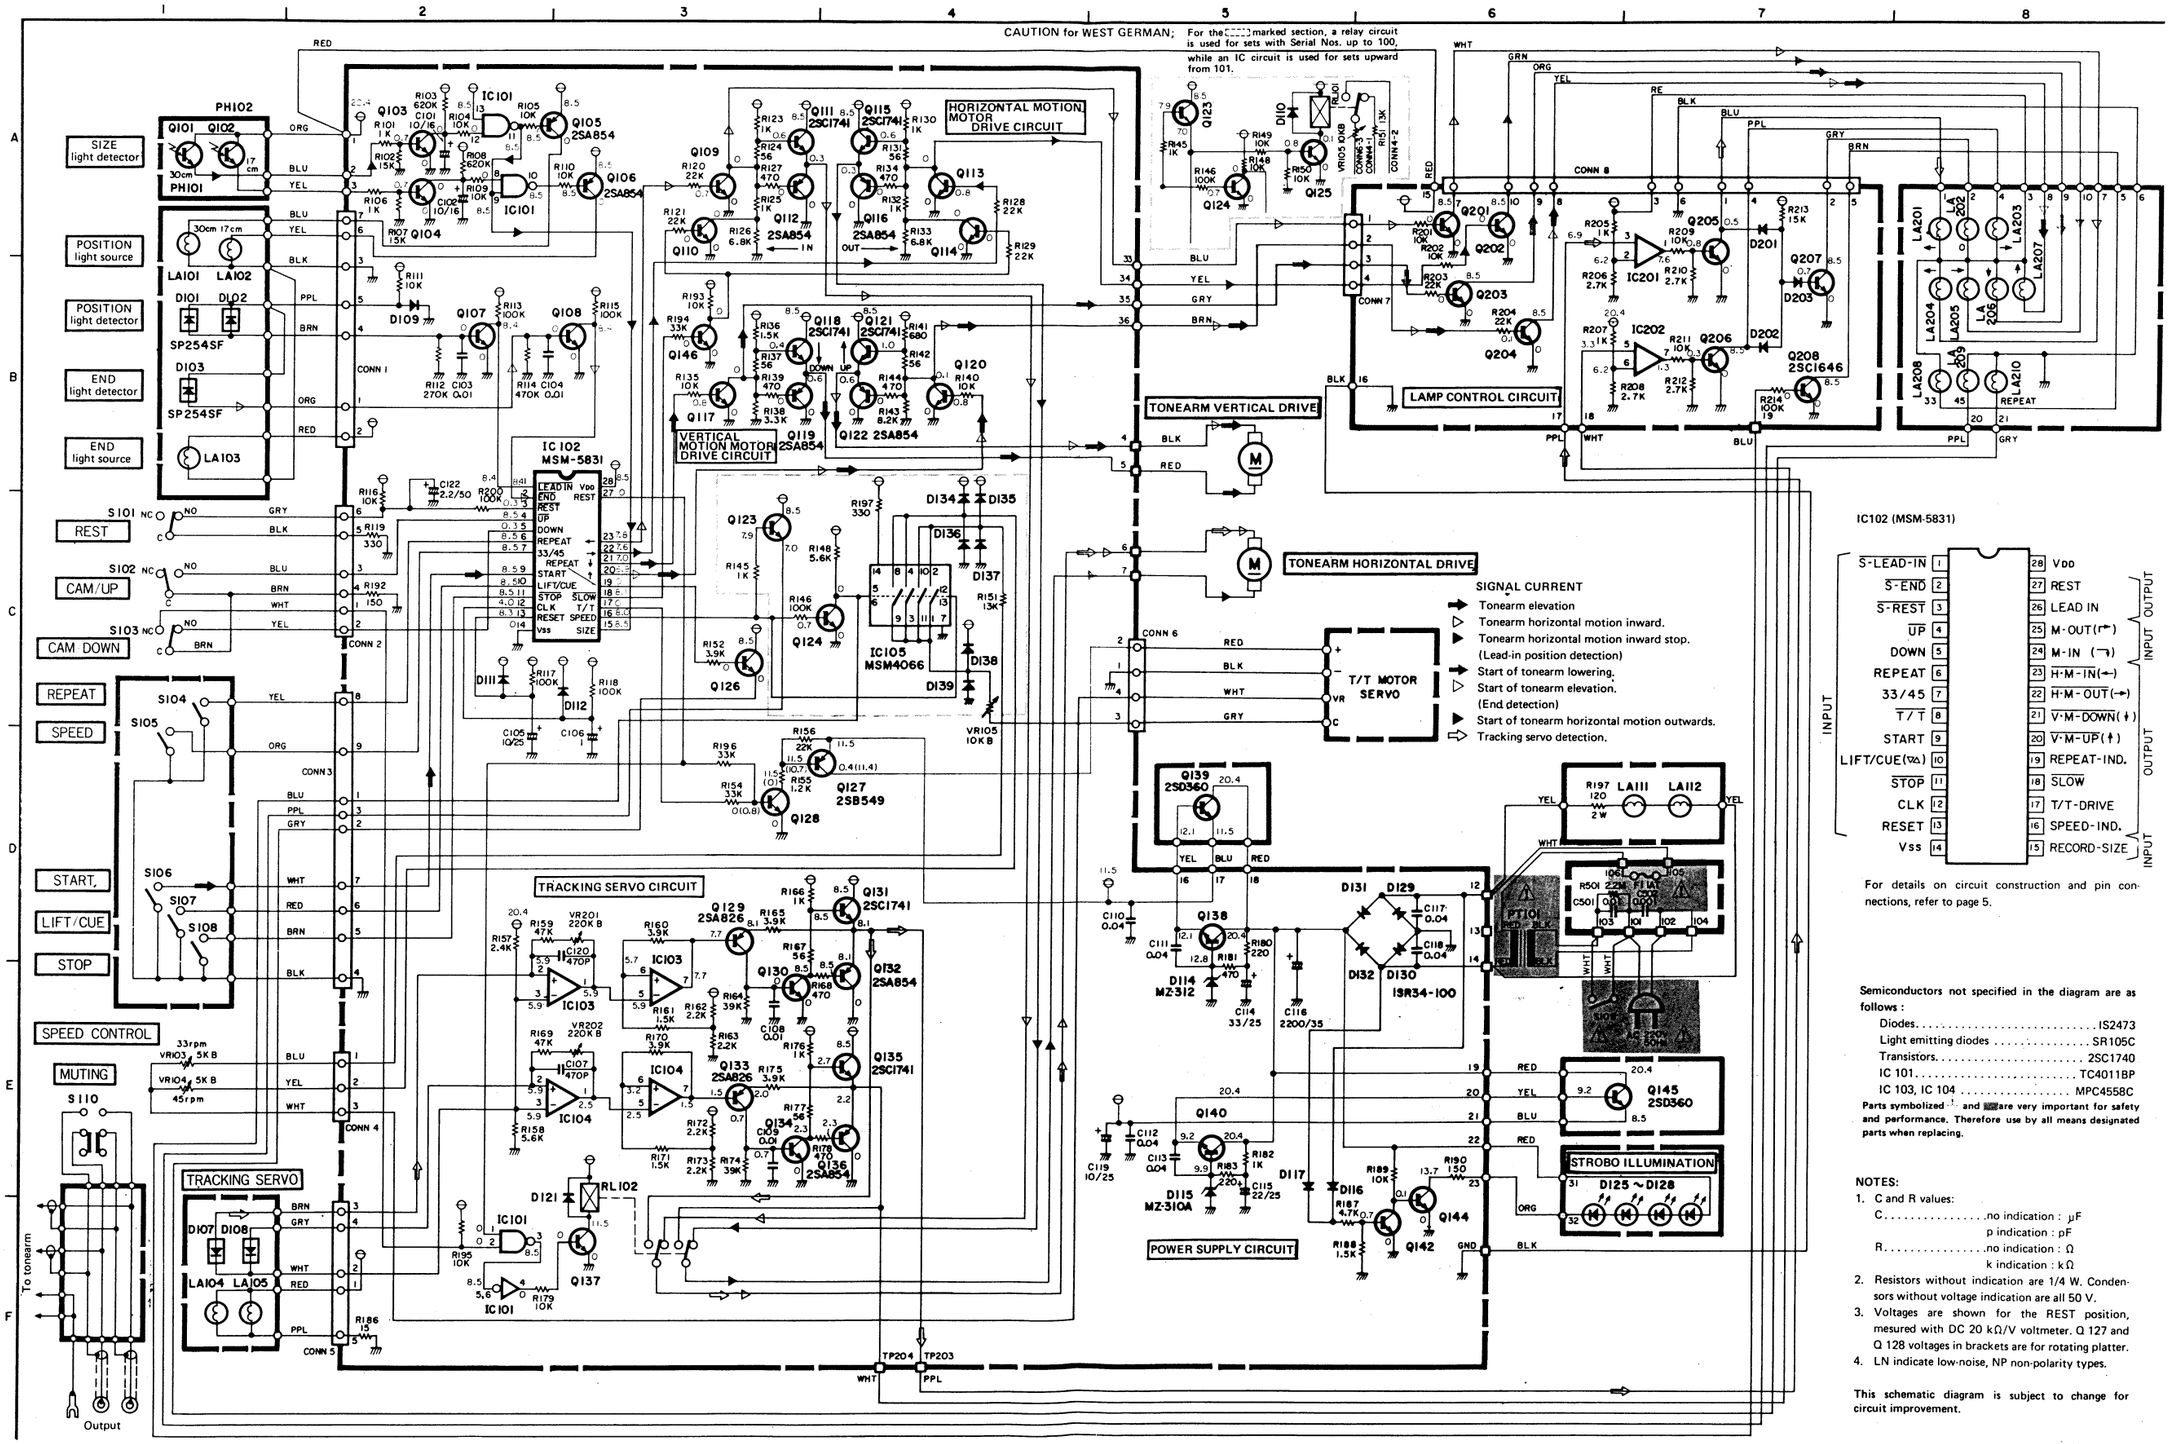
LAMP P.C. BOARD



SWITCH P.C. BOARD



SCHEMATIC DIAGRAM



For details on circuit construction and pin connections, refer to page 5.

Semiconductors not specified in the diagram are as follows :

Diodes	IS2473
Light emitting diodes	SR105C
Transistors	2SC1740
IC 101	TC4011BP
IC 103, IC 104	MPC4558C

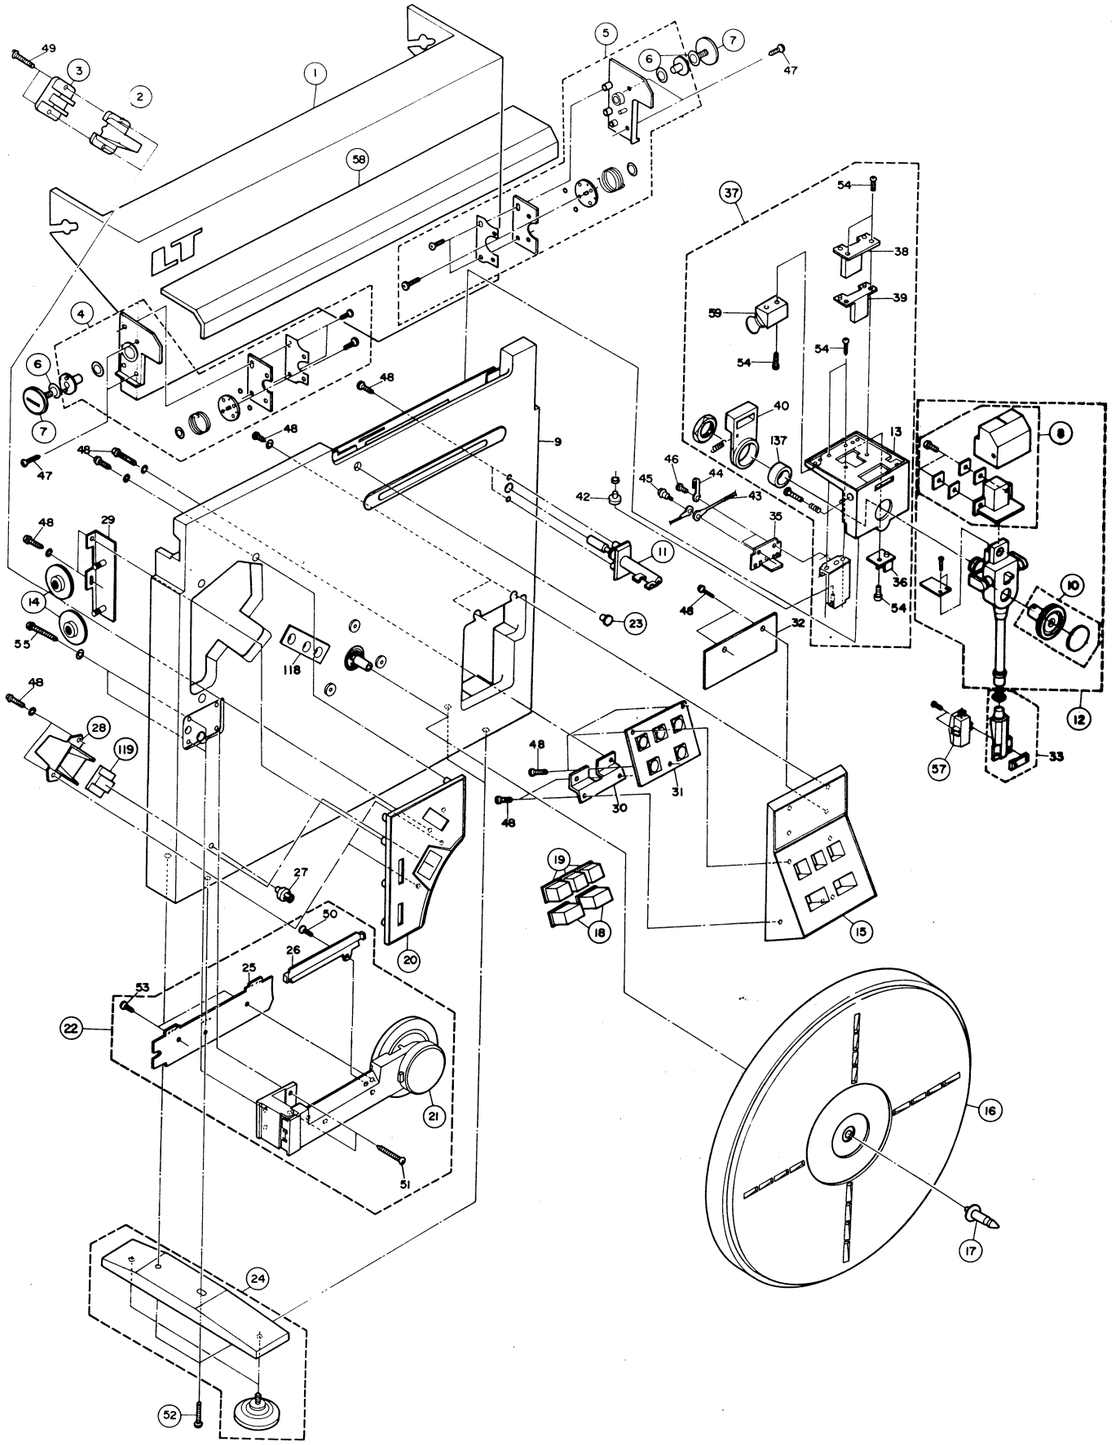
Parts symbolized ⚠ and ⚠ are very important for safety and performance. Therefore use by all means designated parts when replacing.

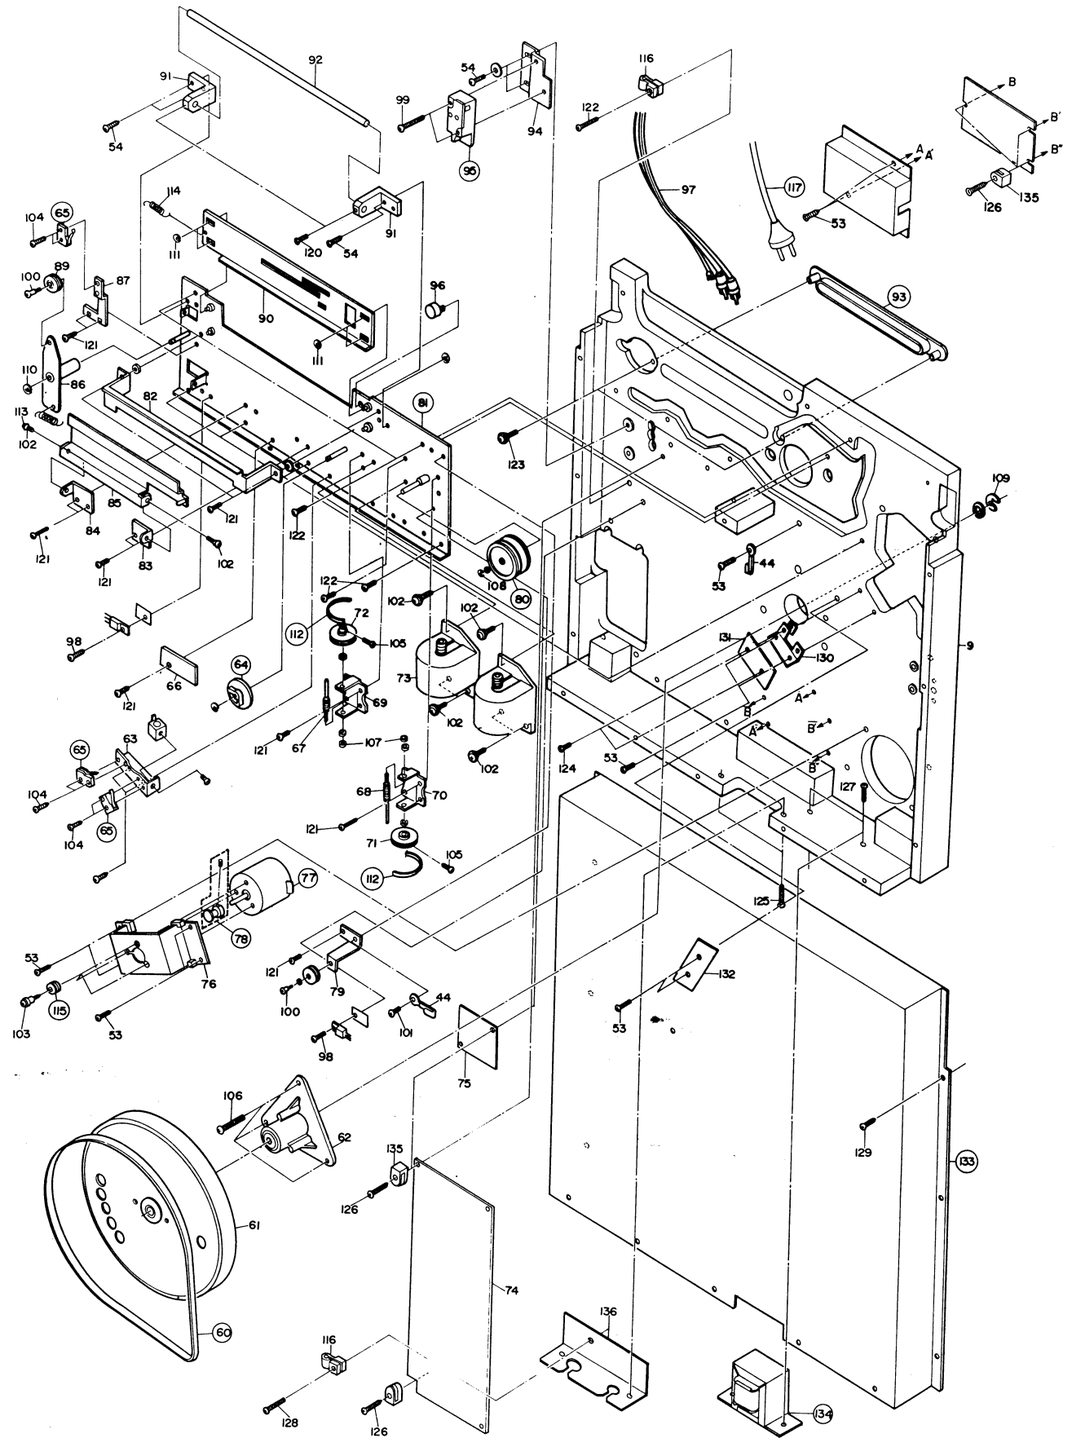
NOTES:

1. C and R values:
   C ..... no indication : μF
   p indication : pF
   R ..... no indication : Ω
   k indication : kΩ
2. Resistors without indication are 1/4 W. Condensors without voltage indication are all 50 V.
3. Voltages are shown for the REST position, mesured with DC 20 kΩ/V voltmeter. Q 127 and Q 128 voltages in brackets are for rotating platter.
4. LN indicate low-noise, NP non-polarity types.

This schematic diagram is subject to change for circuit improvement.

EXPRODED VIEWS





PARTS LIST

NOTE: ⚠ and [redacted] marked components on Parts list have special characteristics to keep safety performance of this unit. When replacing any of these parts, be sure to use only specified parts.

Electrical parts		
LA101	M07374251	Lamp (Position light source)
LA102	M07374251	Lamp (Position light source)
LA103	M07374251	Lamp (End light source)
LA104	M07374251	Lamp (Tracking servo light source)
LA105	M07374251	Lamp (Tracking servo light source)
LA111	M07297250	Lamp (Refractor light source)
LA112	M07297250	Lamp (Refractor light source)
LA201	M07374251	Lamp (Tracking indicator)
LA202	M07374251	Lamp (Tracking indicator)
LA203	M07374251	Lamp (Tracking indicator)
LA204	M07374251	Lamp (Lead-in indicator)
LA205	M07374251	Lamp (Lead-out indicator)
LA206	M07374251	Lamp (Tonearm down indicator)
LA207	M07374251	Lamp (Tonearm up indicator)
LA208	M07374251	Lamp (33 speed indicator)
LA209	M07374251	Lamp (45 speed indicator)
LA210	M07374251	Lamp (Repeat indicator)
PT101	M07479549	Power transformer △
RL101	M07374460	Relay
RL102	M07215465	Relay (Tracking servo select)
F1	M07352490	Fuse-1A-SEMKO △

Symbol No.	Part No.	Description
S101	M07297450	Micro switch (Rest)
S102	M07297450	Micro switch (Cam/Up)
S103	M07297450	Micro switch (Cam/Down)
S104	M07445660	Push switch (Repeat)
S105	M07445660	Push switch (Speed)
S106	M07445660	Push switch (Start)
S107	M07445660	Push switch (Lift/Cue)
S108	M07445660	Push switch (Stop)
S109	M07459660	Micro switch (Power) △
S110	M07445661	Slide switch (Muting)
VR103	M07445435	Variable resistor (5KΩ-B, Speed fine adj.)
VR104	M07445435	Variable resistor (5KΩ-B, Speed fine adj.)
