TO REMOVE THE PRINTED CIRCUIT BOARD

1. Remove the 2 setscrews on each side of the set to detach the cabinet.
2. Remove the latch which secures the input terminal on the rear panel, and the 2 setscrews (1, 2 in Fig. 2) which fasten the speaker terminal.
3. Remove the setscrew (3) used to secure the printed circuit board.
4. Remove the setscrews (4 ~ 6) which fasten the heat sink.
5. Cut off the lead clamp (SHR301) shown in Fig. 1.
6. Remove the 6 setscrews to detach the front panel as shown in Fig. 2.
7. Pull out the two connecting rods of the push-switch from the chassis.
8. Raise the printed circuit board up to a right angle to the chassis as shown in Fig. 3.

 ① - ⑧/⑤ - ④ : 120V ⑧ - ⑦/④ - ③ : 110V
 - Indicated voltage values are the standard values for the DC electronic circuit tester (high impedance) with the chassis taken as standard. Therefore, there may exist some errors in the voltage values, depending on the internal impedance of the DC circuit tester.
 - Signal line Positive voltage line
 - Indicates that only parts specified by the manufacturer be used for safety.

● Protection Circuits

This set incorporates a DC protection circuit to protect the speakers from DC voltage applied to the speaker terminals due to circuit troubles, etc. and an overload protection circuit to prevent breakdown of the output stage due to overload.

The overload protection circuit is illustrated in Fig. 4. In this circuit, if the voltage at the emitter (terminal 8) of the output stage is 10V, the base voltage of Q103 will be about 9V. Then, the emitter voltage of Q103 is about 9.8V ($R_L = 8\Omega$), divided by R_E and R_L . Therefore, this transistor will not operate.

When the speaker terminals are short-circuited, the emitter voltage of Q103 is 0V, that is, the transistor turns ON. Then, the collector potential decreases causing Q301 and Q302 of the switching hold circuit to operate, and then the speaker circuit relay is turned OFF by the relay drive circuit.

This circuit is also a kind of impedance detection circuit since it is designed to operate when R_L is less than the specified load impedance as well as when the speaker terminals are short-circuited.

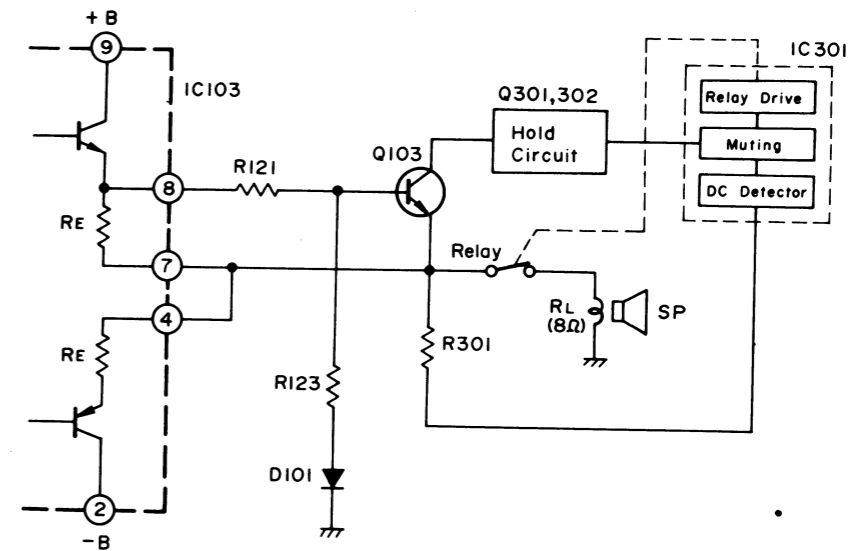

Fig. 4

The overload protection circuit continues operating unless the power supply is cut off. If no output is given with power supply turned ON, turn off the power switch to check the speakers and speaker terminals for abnormality such as shortcircuit.
