## CIRCUIT DESCRIPTION

The KA-5700 is equipped with a **differential amplifier**, **current mirror circuit**, **Darlington circuit**, and **protection circuit**. Information regarding their circuit operations is obtainable from the service manuals for the L-07M, L-07C, and the KA-8100.

- Differential amplifier ..... L-07M
- Current mirror circuit ..... L-07C
- Darlington circuit ..... L-07M
- Protection circuit ..... KA-8100

\* Power transistors 2SB617A and 2SB587A used in the KA-5700 are given a marking of (1). This marking indicates that the transistor legs are bent at right angles. It is not an hFE rank designation.

## Note 2:

Resistors except the special type (example: cement, metal film, etc.) are not detailed in PARTS LIST. With regard to the value, refer to the schematic diagram or the PC board illustration. Resistors not detailed are carbon type (1/4W or 1/8W). You should give an order for the carbon resistors according to the ways described as follows:

A carbon resistor's part number is example RD14BY 2E 222J

### 1. Kinds of the carbon resistor

RD14BY

RD14CY

### 2. Wattage

1/4W → 2E

1/8W → 2B

### 3. Resistance value

Significant figure      Multiplier

Example:

221 → 220Ω

222 → 2.2kΩ

223 → 22kΩ

224 → 220kΩ

225 → 2.2MΩ

### 4. Tolerance

J = ±5% (Gold color)

K = ±10% (Silver color)

# ADJUSTMENT

## METER RANGE ADJUSTMENT

1. Connect a dummy resistor and an SSVM to the speaker terminals and an AG (1 kHz) to the AUX terminal.
2. Use AG and volume control to obtain a setting of 40W (17.88 V/8 Ω).
3. Turn semi-fixed resistors VRm7, 8 until 40W is indicated at the power meter.

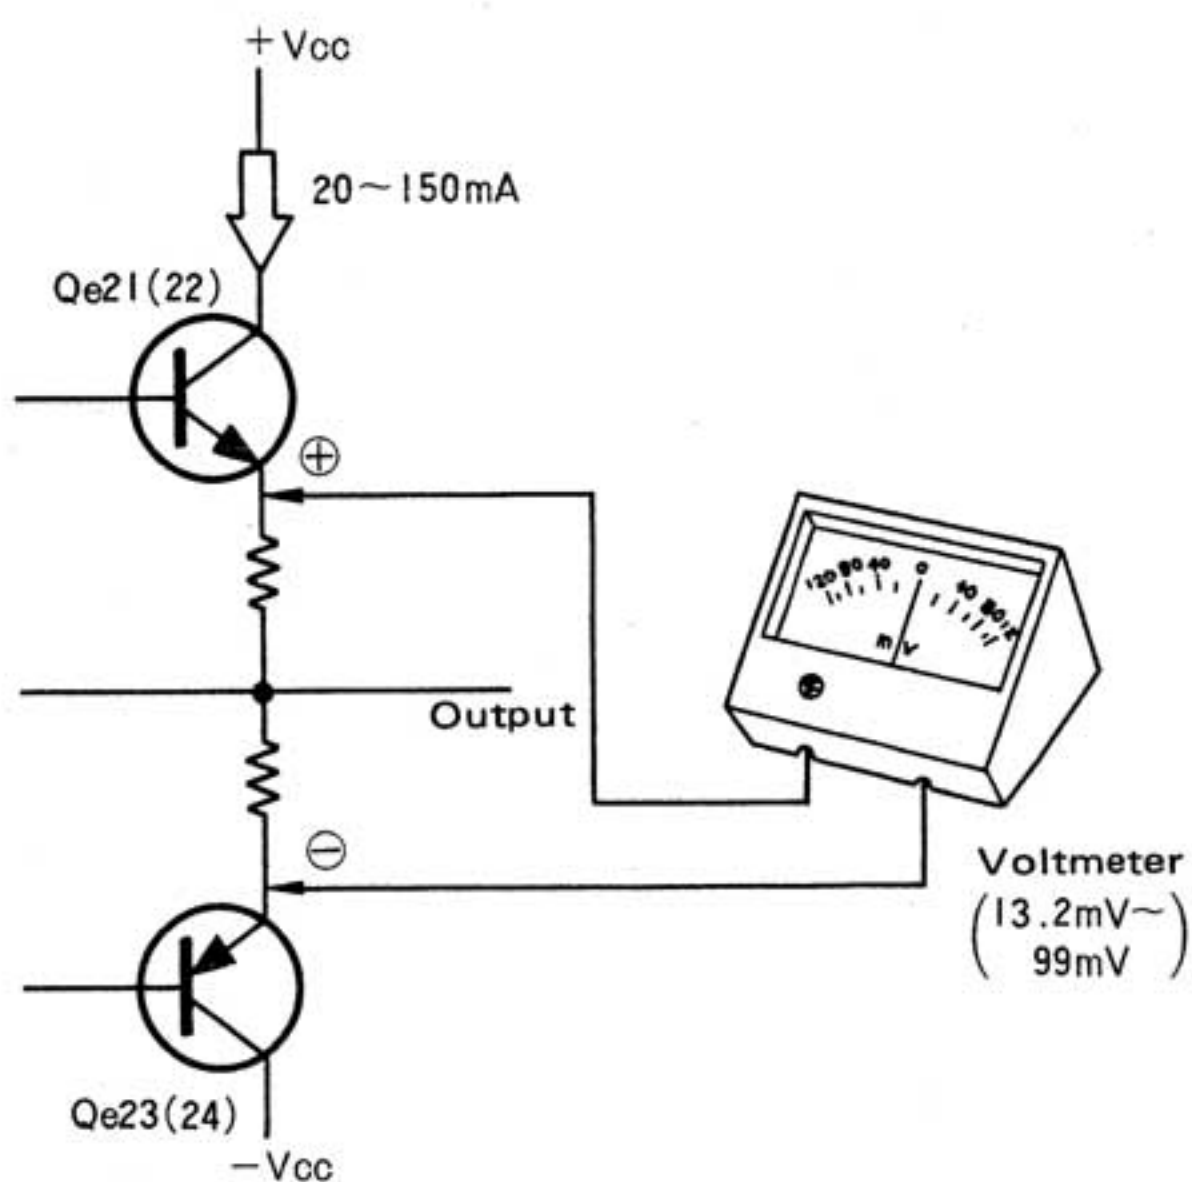

## BIAS CURRENT ADJUSTMENT

There is no adjustment to be made by semi-fixed resistors in a conventional manner. According to the type of set, Rm93 and 94 (27 Ω), or Rm55 and 56 (39 Ω), or 27 Ω and 39 Ω in parallel connection are provided in place of the semi-fixed resistors.

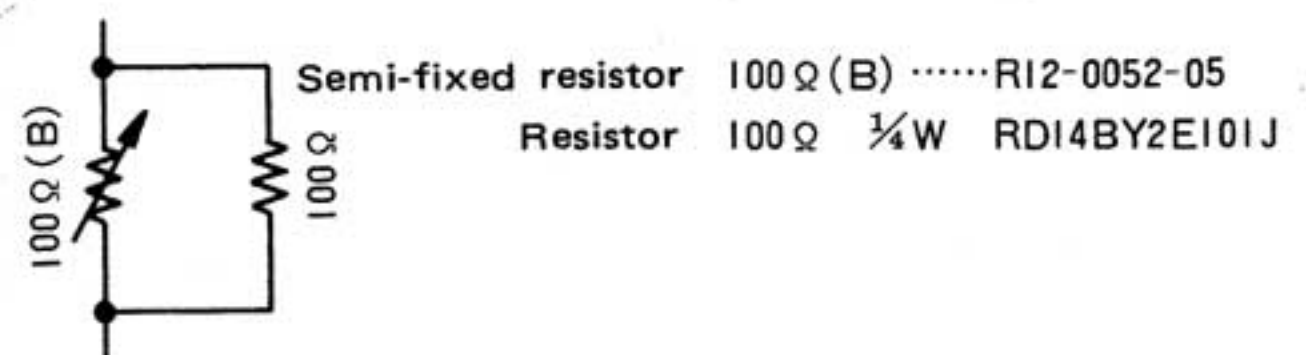

The bias resistance value need not be changed even when power transistor or a driver transistor is replaced. However, it is necessary to confirm that the bias current is within the range of 20 ~ 150 mA.

The current value may be changed widely if the varistor (STV-4H) is changed. Therefore bias current must be checked whenever this varistor has been replaced.

If adjustment is difficult to achieve, do not use the resistor and instead use the following circuit consisting of a semi-fixed resistor and a solid resistor. The printed circuit board is provided with mounting holes so that the resistor can be replaced by a semi-fixed resistor.
